# Acknowledgements

I want to thank Professor Gustaf Olsson for his constant support and never-ending enthusiasm. He has created an open research atmosphere at IEA with contacts both in academia and industry. I have directly benefited from this through my external supervisor Dr Bo Eliasson, Ellips Data AB in the Sydkraft group. He suggested the use of controlled loads for damping and has actively contributed to my work. Bo is a busy man and I am very thankful for the time that he has devoted to me.

My work is a part of the Distribution Automation (AED) project, that was initiated by Gustaf Olsson, Bo Eliasson and Hans Ottosson, Sydkraft R&D (now with Enersearch AB, Sydkraft group). Bo Eliasson has been chairman of the steering committee, that also consists of Gustaf Olsson, Professor Lars Gertmar, IEA/ABB, Professor Jan Rønne Hansen, Dept. of Electric Power Engineering at DTU, and Thomas Pehrsson, Malmö Energi AB in the Sydkraft group. The committee has been a valuable forum for discussions and has promoted many contacts and visits. I especially appreciate the many opportunities that I have had to practice my Danish at DTU.

The planning of the field test started at an Indian restaurant in Baltimore, when I dined with Magnus Akke. The results were made possible by a teamwork of different people within the Sydkraft group: Villy Nilsson and Per-Erik Nyqvist at the operation center in Hemsjö, Jan Evert Nilsson and Johan Sjöwall, Elektro-Sandberg AB and Tomas Åkesson, Sydkraft Eldistribution AB Energiområde Blekinge. Their assistance and their interest, is gratefully acknowledged. I feel privileged for being given the opportunity to participate, which is due to Magnus Akke. I hope the great cooperation with him will continue.

I am thankful to all my colleagues and the staff at IEA for being friendly and helpful, and in particular to Ingvar Ekdahl for pointing out the impedance matching analogy, to Dr Bo Peterson for writing the first thesis on interpretations of electro-mechanical phenomena using mechanical equivalents [Peterson 1996], to Dr Ulf Jeppsson for his excellent support in Unix related problems and to Lars Ericson – the perfect roommate.

I am indebted to my life companion Katarina for her love and support – a support which I hope I can return next spring when she is finishing her thesis.

Thanks also go to Katarina for the help with Fig. 1.1, to Ulf for his contribution to the figures in the appendices and to A. A. Milne who inspired to the brief introductions in each chapter.

The Distribution Automation (AED) project has been supported financially by Sydkraft AB and by NUTEK (Swedish National Board for Industrial and Technical Development) through Elforsk AB as a project within the Elektra R&D program. This support is gratefully acknowledged.
